GITFLOW

MASTER

It's the version in production

DEV

The version currently in development for the next release
When enough features are implemented, merge the dev branch into **master**.

FEATURE

Feature branches are used for new features or bug fixes. They typically exist only in local repos and aren't shared with others. When finishing a feature branch, merge the feature branch into **dev**, and delete the feature branch from the local repository.

HOTFIX

Hotfix branches are created on top of master

Hotfixes are for quickly pushing out a change to our production branch. Common examples of hotfixes are fixing typos, and bugs that need to be pushed out as soon as possible to production.
When finishing a hotfix, merge the changes into both **master** and **dev**.
